Personal Hygiene Unit	Inventor: Kosaburo Watari
	October 10, 2003
<p>Description & Function</p> <p>This Personal Hygiene Unit replaces the expensive traditional toilet equipment that was designed to be in lieu of using toilet paper to that of washing instead of wiping.</p> <p>This PERSONAL HYGIENE UNIT is the least expensive equipment to own, and is an ecological solution when using, as it takes at least half the amount of paper to complete the personal cleansing process. The latter being a plus to those who are faced with septic tank maintenance from time to time.</p> <p>This PERSONAL HYGIENE UNIT is compatible for installation on any toilet, as it is connected to the existing hot waterline nearby. As it is being applied, cold water is slowly turned on and is progressively becoming warm, at which time sufficient washing has been accomplished. There is a health benefit too, as the entire process is smooth and comfortable to perform. Wiping with paper is an abrasive process that can potentially cause pain and irritation in a sometimes sensitive area of the anatomy.</p>
